

August 2015 edition of Nature Geoscience¹

This month's Nature Geoscience features an article and an image on the cover by Professor Bob White. The image shows the Holuhraun fissure eruption in Iceland on 2 September 2014.

The article: [Triggered earthquakes suppressed by an evolving stress shadow from a propagating dyke](#), by Robert G Green, Tim Greenfield and Robert S White.

The role of static versus dynamic stresses in earthquake clusters is unclear. Analysis of earthquakes triggered by a dyke intrusion at an Icelandic volcano unambiguously demonstrates that static stresses are important for earthquake clustering.

Cover design by David Shand.
